STACK

CORE

TypeScript, JavaScript, Node.js, HTML5, CSS and SASS

AI & BACKEND

LLM integration (AWS Bedrock), Node.js microservices and BFF, RBAC (AWS Verified Permissions), usage metering and billing, Prisma/SQL, OpenSearch

REACT & FRONTEND

React, TanStack Query and Router, Emotion, @xstyled, Storybook, Zod

PROFILE

Full-stack engineer on an agentic observability product, where I work across its interface, backend and design system. I have shipped LLM features since 2024: agents that investigate an alert, answer a question or check a deployment, plus the chat product and the metering and billing behind them. I led the rebuild of the company's design system, and led the SIEM platform's move onto Open360 while acting as team lead. I review more code than I write, and the architecture goes in a design doc before it goes in the editor.

EXPERIENCE

Logz.io

OCT 2023 – PRESENT · MUNICH (REMOTE)

Full-Stack Engineer (Jan 2024) → Acting Team Lead (Mar 2026) → **OrionIQ** (Jun 2026)

LEADERSHIP & OWNERSHIP

- **Retained through the 2025–26 reduction** that merged two teams into one 7-person full-stack unit.
- **Acting lead of the application team, Mar–May 2026, while its lead was away.** Planned the quarter with KPIs, a capacity model and a risk register, took part in hiring a senior full-stack developer and the team's next lead, and built the intro-interview framework. Onboarded the new senior full-stack developer and handed the team over to the incoming lead.
- Author **two publication-grade demo recaps a month**, turning a fortnight of cross-repo work into a narrative with verified before-and-after numbers, and have written 30+ design docs and PRDs adopted across teams.

NEW PRODUCTS & PLATFORM MIGRATIONS

- **Brought the SIEM product onto the Open360 platform** (Apr–May 2026): wrote the epic, the technical design and a three-phase plan, then delivered the workspace infrastructure, the Explore integration, the AI investigation pipeline, security rules, event management, threat feeds and lookups and the dashboard migration, with three teammates on the parallel phases. Released to all users in May 2026.

ARCHITECTURE

Design systems, performance (Web Workers, OPFS), real-time streaming UIs (SSE), micro-frontends, monorepos

DATA VIZ

Highcharts, Perses, Monaco (PromQL and Lucene), virtualized tables

TESTING & CI/CD

Jest, RTL, Playwright, Puppeteer, Docker, GitHub Actions, Nx, ArgoCD

EDUCATION

Full-Stack Web Development
HackerU, Tel Aviv · 2021–2022

CS Foundations Coursework
Academic College of Tel Aviv-Yaffo · 2020–2021

Self-directed study
2022 – Oct 2023

Military reserve service
Oct 2023 – Jan 2024

- **On OrionIQ**, spun out as its own product, where I work across its interface, backend and design system, whether a run starts from a conversation, an alert, a dashboard or a deployment, over telemetry that is not always my employer's. Extracted the `orioniq-chat` package and shipped an embeddable chat drawer now live in Open360, and built components for CosmIQ, the design system that grew out of LUI: the select, the tables and DataTable, filter menus, a shared drag-resize primitive and the travelling layer.
- **Replaced the legacy AI agent across two applications**, bringing OrionIQ chat into the Classic app behind one drawer and trigger. Deleted 124 legacy files and ~5,400 net lines, and cut the entry point from **333 KB to 16 KB gz**.
- **Built the page-context system the agent reads the product through**, replacing a hardcoded Explore-only path with a generic seam and teaching it five pages. Adding a page went from a sprint to a day.
- **Backend on the Agents Hub**: made the actor a required argument on every write so a request body cannot forge it, collapsed **50 identity lookups per page to 1**, and recovered a customer account stuck in permanent AI failure by making that state self-heal on deploy.

FRONTEND ARCHITECTURE & DESIGN SYSTEMS

- **Saw the design system had drifted**, made the case for rebuilding it, then led it: LUI, with token-based theming and an adoption-metrics framework.
- **Migrated the legacy app onto a new TanStack Router and Zod workspace** built on LUI, shipping features on the old app the whole time, then added open-source parity pages (Grafana, OSD, Jaeger) so no user was stranded in the transition.
- **Core contributor to Explore**, the log-search page: a virtualized table, search and visualizations over very large result sets, with a non-blocking OPFS and Web Workers cache that fixed a cross-browser bug blocking render and multi-tab fetches.
- Merged upstream fixes to **xstyled** (2.3k★), the style-props library LUI builds on, after hitting an inference bug while building the design system, plus accessibility and lifecycle fixes to the open-source tour library OrionIQ depends on. Published `text-cascade`, a per-character React text reveal, to npm.
